

Optical Marketplace Complete User Manual

Buyer Website and Mobile App | Seller Portal | Admin Portal

A simple, practical reference for the full marketplace project. It explains what each role can do, where each option is located, and how actions move through the platform.

This document describes the functionality available in the current project source. Some options are shown only when the signed-in account has the required role, account status, or configured permissions.

1. PLATFORM OVERVIEW

1. PLATFORM OVERVIEW

One marketplace, three working areas

Optical Marketplace connects shoppers, stores and platform staff in one shared commerce system. Buyers discover and purchase optical products. Sellers run stores, fulfil orders and market products. Admin users supervise the platform, money flows and moderation.

Buyer Uses the Buyer Website or Buyer App to browse stores and products, configure optical items, place and pay for orders, communicate with stores, and manage account tools.	Seller Uses the Seller Portal to set up a store, publish products, accept and deliver orders, manage promotions, use the warehouse supply channel and communicate with buyers or Admin.
Admin Uses the Admin Portal to manage people, stores, catalogues, campaigns, orders, finance, reports, support and platform settings.	Shared Laravel backend Keeps accounts, products, orders, payments, messages, notifications, wallets and permissions in one source of data for all project frontends.

Important

The platform creates store-specific shipments inside an order. A buyer can place one checkout order containing items from more than one store; each store works on its own shipment and delivery status.

1. PLATFORM OVERVIEW

1. PLATFORM OVERVIEW

How to read this manual

This manual is written for a client or day-to-day user. It uses the same practical pattern throughout so each function is easy to find and understand.

Feature	Where	What the user can do
What	Feature name	A short plain-English explanation of the purpose of the page, screen, card, tab or control.
Where	Navigation path	The usual route to the option. Desktop sidebars, headers, profile menus and the Buyer App tabs can expose the same function in different places.
Action	Buttons, filters or forms	The key choices a user can make, including search, status filters, add/edit forms, date fields, image uploads, toggle switches and confirmation dialogs.
Result	After save, submit or confirm	What the system updates next: a list, a status, wallet history, an order, a notification or another connected role.

Reading notes

- **Lists** normally support loading, empty and error states. Search, filters and page controls appear only where the feature needs them.
- **Dates and time** are shown in the user's local display format. Scheduled campaign and coupon dates use the configured schedule/time-zone data.
- **Notifications** are role-specific. Opening a notification can mark it read and take the user to its related order, message or other record when a link is provided.
- **Permissions** matter. A seller pending approval, a suspended store, or an Admin account without an ability may see fewer actions.

Scope

The project includes the Buyer Website, Buyer Expo mobile app, Seller Portal, Admin Portal, Laravel API and a read-only CRM integration. The manual documents the features found in those project areas; it does not invent future features.

1. PLATFORM OVERVIEW

1. PLATFORM OVERVIEW

Navigation, account and list behaviour

The visual layout differs by role, but the practical controls are consistent. This page explains recurring buttons and states so later sections can stay simple.

Feature	Where	What the user can do
Sign in / sign out	Headers, profile menus, auth pages	Create an account, sign in, request a password reset, verify a code when the flow asks for it, and sign out to end the session.
Header icons	Buyer and Seller headers	Open notifications, cart or other role-specific quick tools. Badges show unread or item counts when data is available.
Search	Catalogues and management lists	Type a product, store, coupon, order or person reference. Submit or apply the query to refresh matching results.
Filters and sorting	List pages	Select status, type, scope, payment or other available values. Clear a filter to return to the full list.
Add / Edit	Management pages	Open a form or wizard, complete required fields, attach a file if needed and save. Validation messages explain missing or invalid values.
Toggle / Pause	Status controls	Turn a record on or off, or pause and resume it. History stays visible even when a record is paused or archived where supported.
Confirm dialog	Delete, close, archive and finance actions	Review the action before confirming. Destructive actions can remove or retire a record; order and finance histories remain protected by workflow rules.

Automatic updates

The web and mobile clients use live refresh patterns for key data such as wallet balances, notifications, messages and management lists. A successful action also reloads the relevant record so the new state is visible.

1. PLATFORM OVERVIEW

1. PLATFORM OVERVIEW

Platform relationships at a glance

The same records are visible from different roles. For example, a product created by a Seller becomes a Buyer catalogue item after its state and visibility allow it; Admin has an oversight view.

Feature	Where	What the user can do
Product	Seller Products -> Buyer Product Details -> Admin Products	Seller owns product data; Buyer sees active products and options; Admin can inspect, approve/reject, control visibility, mute, boost or delete under its authority.
Store	Seller Store -> Buyer Stores -> Admin Sellers / Store Reports	Seller controls public profile, images and settings; Buyer can browse, follow, review, report or chat; Admin reviews seller/store actions and reports.
Order	Buyer Checkout -> Seller Orders -> Admin Orders	Buyer places and later pays a store shipment; Seller accepts, sets delivery information and confirms delivery; Admin can inspect and take permitted status actions.
Finance	Buyer Wallet -> Seller Wallet -> Admin Finance	Buyer wallet records funding/withdrawal transactions. Seller wallet records earnings, ad funding/spend and payouts. Admin sees platform-ledger, wallet and withdrawal controls.
Campaign	Seller Marketing -> Buyer promotions -> Admin moderation	Seller runs discount, coupon, referral, banner, announcement and boost work. Buyers receive eligible offers. Admin can supervise relevant campaigns and related finance.

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer access and account setup

The Buyer Website has dedicated authentication pages and the Buyer App has onboarding plus sign-in choices. A buyer can create an account, recover access and manage personal information after signing in.

Feature	Where	What the user can do
Choose account	Buyer auth / Buyer App onboarding	Choose the buyer route before registration. The public Sell page also explains how to start a seller application.
Register	Buyer auth register	Enter the requested buyer details, create a password and submit. The account is then used across the website and app.
Login	Buyer auth login	Enter email and password. The system returns to the requested page when a protected action triggered login.
Forgot / reset password	Buyer auth pages	Request a reset, enter the supplied code or required confirmation information, then choose a new password.
Email / phone verification	Buyer profile	Request and submit verification codes when shown. Profile security features can require a one-time email code for a password change.
Delete account	Buyer profile account options	Request account deletion from the protected profile control. Follow the confirmation message carefully because this is a sensitive action.
Mobile note	The Buyer App mirrors the key account journey: onboarding, account choice, sign-in, sign-up, password recovery, email verification and authentication success before opening the shopping tabs.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer home, catalogue and categories

The Buyer home experience is the starting point for discovery. It combines stores, products, promotional content and practical links into shopping areas.

Feature	Where	What the user can do
Home	Buyer header / Buyer App Home tab	View the marketplace landing content, promotions, banners, product discovery cards and links into shopping areas.
Products	Products page / Buyer App Shop tab	Browse the product catalogue and open any item for full details. Product cards show the available image, name, price and store context.
Categories	Categories -> category page	Open a category and browse its products. Category results provide product search and price range fields; use the filter values to narrow the list.
Search	Search page / top navigation	Search products and stores from one input. Results are separated so the buyer can open the matching product or the store.
Campaigns and banners	Home / campaign links	Open eligible discount campaign pages and promotional banner destinations. Campaign pages show the campaign description, end date, minimum requirements and eligible products.
Advertisements	Buyer catalogue placements	View marketing placements served to buyers. Ad events are recorded by the platform when the configured placement is used.
Result	Opening a product, category or store never changes the cart by itself. The buyer reviews details and options before choosing an add-to-cart or checkout action.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Product details and optical customisation

A Buyer product page is more than a product card. It can show product details, store information, reviews and configuration inputs needed for optical products.

Product details Open Products -> product . Review the product name, images, pricing, descriptions, store, available variants and reviews before selecting an action.	Product options Use the product-option selector to choose available variants or product-specific values. The system recalculates the selected item before it is placed in the cart.
Prescription entry For products that need prescription data, use the prescription entry flow. Buyers can use saved prescription data or provide the fields required by that product.	Lens configuration Where enabled, select lens type, thickness/material, treatments or coatings. The available choices are delivered by configured lens and category data.
Contact lenses and eye care Contact lens product forms expose their applicable configuration data. Eye hygiene products use their product-specific details and options.	Reviews Read product reviews and submit a review only through the allowed review workflow. Purchase eligibility is checked by the backend.

- 1 Open the product and choose its options, size/variant or optical configuration where the product offers it.
- 2 Review the chosen configuration and price in the product option or checkout confirmation view.
- 3 Add the configured item to the cart, or continue with the product checkout action if it is offered.
- 4 The resulting cart/order item keeps its product, variant, lens configuration and prescription data for the order workflow.

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Stores, follows, reviews and store chat

Each Seller has a public store presence. Buyers can browse the store, see its products and interact with the store without leaving the Buyer experience.

Feature	Where	What the user can do
All Stores	Stores page / Buyer App Stores tab	Search stores, open a store profile and browse the store's available products.
Store profile	Stores -> store	See store information, product listings, active public social links and store reviews. The visible store data comes from the Seller store profile.
Follow / unfollow	Store page and Profile -> Followed Stores	Follow a store to keep it in the buyer's follow list. Unfollow removes it from that personal list.
Store reviews	Store page	Read reviews and submit or manage a store review only where the buyer is eligible. The backend checks review rules.
Report a store	Store page	Describe an issue in the store report form. The report enters Admin store-report handling rather than changing the store immediately.
Store chat	Store page -> chat / Buyer App Messages	Start or open a conversation with a store. See the message history and send messages through the Buyer-to-Seller chat channel.
Connection	A store's active social links, banner/profile images, products and public details are maintained from the Seller side. The Buyer sees only the public/active result.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Wishlist, saved items and shopping cart

The buyer can save products for later and build a cart containing product selections. Cart operations are kept on the buyer account and are prepared for checkout.

Feature	Where	What the user can do
Wishlist / Saved Items	Wishlist page / Profile -> Saved Items	Save a product, review saved product cards later, open the product again or remove it from saved items.
Cart	Cart page / Buyer App Cart tab	Review cart items and groups, update quantity where allowed, remove an item, clear the cart and continue to checkout.
Cart item data	Cart item	Shows the selected product and the option/configuration associated with it. This preserves choices such as a variant or lens configuration.
Order summary	Cart and Checkout	Shows item totals and calculated figures before order placement. Coupon and delivery values can affect the final store shipment amount.
Cart count	Header / mobile navigation	Shows that the buyer has items ready for checkout. The count changes after add, update, remove or clear actions.
Practical tip	If an item needs product options or prescription information, complete that step before cart submission. A product cannot be treated as a final optical order until the required selection is valid.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Coupons, discounts and checkout preview

Eligible offers are calculated by the backend. The Buyer can discover a public promotion and, during cart/checkout, apply a valid coupon where the shipment qualifies.

Feature	Where	What the user can do
Applicable coupons	Cart / Checkout	View coupon options that apply to the selected store, product or category context. A coupon may be limited by scope, dates, minimum amount, usage limits or buyer rules.
Validate coupon	Cart / Checkout	Enter or select a code. The system validates it against the order and shows the quote/result before it is applied.
Apply / remove	Cart / Checkout	Apply a valid coupon to the current calculation or remove it to return to the original price. The final quote is rechecked at order placement.
Discount campaign	Campaign page / product pricing	Open a campaign to view its rules and eligible products. Product/campaign pricing is calculated through the commerce campaign service.
Referral eligibility	Referral campaign links	A referral link can attribute a buyer to an eligible campaign. Rewards are only issued after the configured qualifying order outcome.

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Checkout, payment and delivery address

Checkout creates an order that can contain one or more store shipments. The website makes clear that payment follows seller review when the shipment requires a delivery quote.

Feature	Where	What the user can do
Delivery address	Checkout / Profile -> Addresses	Choose an existing address or create, edit, delete and set a default address before placing an order.
Checkout preview	Checkout	Review delivery address, store/cart lines, discounts and the order summary before placing the order.
Place order	Checkout	Submit the order. The platform creates the buyer order plus store-specific shipment records for the participating sellers.
Seller review	After placement	The Seller receives a pending shipment and accepts/rejects it. On acceptance, the seller can set delivery fee, estimated date, method and notes.
Pay shipment	My Orders -> order/shipment	For a shipment awaiting payment, use the payment action. Payment information is loaded for the relevant store shipment.
Delivery data	Order details	See estimated delivery date, method, fee and notes after the Seller has supplied them. The buyer can later see the delivery code when it is issued.
Order structure	A buyer-level order provides the combined checkout record. Each Seller receives only its own store shipment and its related items, payment and delivery action controls.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer orders, payment and completion

My Orders and the Buyer App Orders tab show order history. An order opens into store shipments so the buyer can track and act on each seller's part of the purchase.

Feature	Where	What the user can do
Order list	My Orders / Buyer App Orders	Open completed and active orders, view store-shipment status badges and use review actions after an eligible delivery.
Order details	Orders -> order	See the buyer order, its store shipments, item lines, product variants, lens/prescription information, address snapshot, totals and payment information.
Shipment status	Order details	Track pending, awaiting payment, paid, processing, out for delivery, delivered, cancelled and other returned workflow states when applicable.
Delivery code (OTP)	Order details	When shown, provide the code only after receiving the products. It is used to confirm delivery and release seller earnings through the platform workflow.
Delivery summary	Order and store-order detail	Review address, estimated date, method, notes and delivery fee for that store shipment.
Review completed purchase	Delivered shipment	Review the store and each eligible product after delivery. The review form is tied to the relevant store order.
If something is wrong	Use the order's available cancellation/dispute/support path instead of changing information outside the platform. Admin order tools and store-report/support processes provide the oversight route.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer wallet, points and financial history

Buyer account tools include a wallet and a points area. Wallet actions create history records; limits and payment methods are checked by the backend before a balance changes.

Feature	Where	What the user can do
Wallet	Profile -> Wallet	See available balance, recent transactions and buttons for top up and withdrawal.
Top up	Profile -> Wallet -> Top Up	Enter a valid amount. The current interface validates a minimum of EUR 5 and records the successful funding action in transaction history.
Withdraw	Profile -> Wallet -> Withdraw	Enter an amount and bank details. The current interface validates available balance, a EUR 10 minimum, account holder, account number and bank name before submission.
Wallet transactions	Profile -> Wallet	Read date, description/type, payment method where provided, amount and transaction status. Referral rewards and reversals are clearly labelled.
Points	Points page	View points balance, transaction history and redemption options. Point rules are controlled by Admin.
Payment capability	Wallet / checkout services	The backend publishes wallet/payment capabilities so the client can present permitted funding or payment choices.
Result	Top ups and withdrawals are not just visual balances. They write transaction records, and Admin Finance can audit buyer transactions and manage the relevant platform finance records.	

2. BUYER USER MANUAL**2. BUYER USER MANUAL**

Buyer profile and personal settings

The Buyer profile groups day-to-day account tools. On small screens, profile areas can open as a focused section while preserving the same underlying functions.

Edit profile Update personal account data and profile image. Image upload/delete actions use the buyer profile service.	Addresses Add, edit, remove and set a default shipping/billing address. Checkout uses the selected address snapshot.
Change password Start the protected password change process. The buyer flow confirms the change with a one-time code to the registered email.	Saved Items Open saved product cards, return to product details or remove a saved item.
Followed Stores Review followed store records and return to a store page or unfollow it.	Reviews Review the buyer's review history and use eligible review forms from a delivered order/store order.
Referral Open buyer referral status/tools and campaign attribution details. Share/use only eligible campaign links.	Notifications Open all notifications, use unread counts and mark records read when the notification page action is used.

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer messages, support and help

The Buyer can communicate with stores through store chat and can open formal support tickets. These are separate workflows: a chat is a store conversation; a support ticket is an issue record for support handling.

Feature	Where	What the user can do
Store messages	Store page -> Chat / Buyer App Messages	Open a store conversation, read message history and send a message. The conversation appears on the Seller side under buyer-store messages.
Support tickets	Profile -> Support / Buyer App Support	Create a ticket, choose its requested details, add attachments where the form supports them, view the ticket and reply.
Ticket actions	Support ticket detail	Read replies, download ticket attachments, close a resolved ticket or reopen it if the workflow permits.
Help Center	Help page	Read practical help on shopping/orders, payments/wallet, delivery, returns/refunds, account/security, selling/referrals and contact support.
Shipping / returns / terms / privacy	Footer and help links	Read current policy information. These pages explain delivery quoting, tracking, receipt confirmation, return windows, excluded items, cancellation and policy terms.
Good practice	Attach only information needed to resolve a ticket. For a store-specific question before or after purchase, use the store chat first; for an unresolved platform issue, use Support.	

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer notifications, referral and affiliate areas

Buyer notification and referral tools connect shopping actions to store and campaign activity. They preserve the buyer's own history without exposing seller/admin private data.

Feature	Where	What the user can do
Notifications	Notifications page / header	See unread count and notification list. Open a notification to mark/read it as applicable; use Mark All Read to clear unread state.
Referral campaign link	Referral campaign public page	Open a seller campaign by identifier. The page explains eligibility and guides a visitor to buyer registration or eligible browsing.
Referral dashboard	Profile referral area	See referral attribution/dashboard information and claim or view available referral details where the campaign permits.
Affiliate	Affiliate page	Access the project's affiliate-facing buyer page. Availability and terms are controlled by the current site configuration.
Sell with us	Sell page	Read the seller application journey, approval explanation and what a seller can do after becoming live.

2. BUYER USER MANUAL

2. BUYER USER MANUAL

Buyer App: mobile navigation map

The Expo Buyer App is a mobile companion to the Buyer Website. It reuses the same Buyer account and backend data while arranging common shopping actions into mobile screens.

Feature	Where	What the user can do
Home	App tab	Marketplace home and discovery cards.
Shop	App tab	Browse products, categories, search and open a product.
Stores	App tab	Browse stores, open a store profile and start store chat.
Cart	App tab	Review cart, manage items and continue to checkout.
Orders	App tab	Open order history and detailed order/shipment information.
Messages	App tab	Open buyer-store conversations.
Account	App tab	Profile, addresses, followed stores, referrals, reviews, saved items, support and wallet.
Other app screens	Stack screens	Onboarding, auth, notifications, category, search, product, store, checkout, order detail and chat screens are opened from the appropriate tab/action.
Shared data A profile, cart, wishlist, orders, wallet, messages, notifications and support records come from the same backend services. Users should use the same buyer account to see their history on web and mobile.		

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller access, application and approval

A seller account has its own authentication and store setup path. The account can be pending approval or suspended, and the portal presents the status-specific page rather than opening normal management pages.

Feature	Where	What the user can do
Register	Seller auth -> Register	Create a seller account with the requested business/user details and password confirmation.
Login	Seller auth -> Login	Sign in with the business email and password. Protected pages return the seller to the requested work area after access is granted.
Email verification	Seller auth / account flow	Verify email through the configured code-based flow when required.
Forgot / reset password	Seller auth	Request password recovery, enter the reset code and save a new password.
Initial store setup	Seller onboarding	Complete the store data needed before the seller begins normal operations.
Pending approval / suspended	Seller auth status pages	Read the current account state. A suspended store can access the reinstatement request flow where it is permitted.
Admin connection	Admin Sellers contains approval/rejection controls. Store status is not merely a front-end display; it controls whether a seller can operate and whether public data is available to buyers.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller navigation and Dashboard

The Seller Portal uses desktop sidebar navigation plus a mobile bottom navigation. The Dashboard is the operational starting point for performance, store health and recent work.

Feature	Where	What the user can do
Desktop sidebar	Seller left navigation	Open Wallet, Dashboard, Store, Products, Orders, Discount Campaigns, Warehouse, Coupons, Notifications, Referral Campaigns, Boost Ads, Announcements, Banners, Analytics and Messages.
Mobile navigation	Seller mobile layout	Opens the main shortcuts available in the mobile layout: Wallet, Dashboard, Products, Orders, Promotions and Profile.
Dashboard	Dashboard	View store overview/dashboard data and take immediate action from the seller workspace.
Store statistics	Store / Dashboard	Review store stats, overview, dashboard figures and followers from the Store service.
Analytics	Analytics	See monthly trends, order status breakdown and recent orders. Use it to identify sales and fulfilment movement.
Low stock	Product/inventory service	The backend exposes low-stock inventory data for seller attention. Use product/inventory controls to correct stock.
Navigation rule	Use the page's Back link/browser history to return to the actual previous context. Lists, details and edit pages are separate routes, so an action should not require the user to restart from the Dashboard.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Store profile and public store management

The Store area controls what buyers see on the public store page. It also provides business identity, professional information and policy text used by the marketplace.

Feature	Where	What the user can do
Store overview	Store	See the current store identity and shortcuts to Edit Store, Store Settings and Social Links.
Images	Store -> Edit Store	Upload or delete the profile/logo image and banner image. Buyers see the current public store images when the store is visible.
Core information	Store -> Edit Store	Update store name, description, contact email and phone.
Professional information	Store -> Edit Store	Maintain tagline, business type, registration number, tax ID, business address, website and support email.
Policies	Store -> Edit Store	Enter or update shipping policy and return policy text for buyer-facing store context.
Theme	Store service	Update the store theme data where the store configuration exposes it.
Followers	Store statistics	View follower-related data supplied by the store overview/stats endpoint.
After Save	A successful store update reloads the seller's store profile. Public store pages use active/public store data, so buyers see the updated result through the shared backend.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Store settings, social links and store users

Store settings are separate from profile content. They handle operating visibility/privacy options and supporting store-user access records.

Feature	Where	What the user can do
Store settings	Store -> Store Settings	View and update store settings, including availability and phone visibility options supplied by the current store settings API.
Social Links	Store -> Social Links	Add, edit, delete and toggle active social links. Current platform choices are Facebook, Instagram, Twitter, LinkedIn and YouTube.
Social link state	Store -> Social Links	Set the platform and URL, then keep a link active/inactive. Only active links are included on the buyer-visible public store data.
Store users	Store service	List, add, update and remove store-user records where the seller account has access to the feature.
Reinstatement request	Store service / suspended state	View earlier requests or create a request if the store is suspended and the backend allows reinstatement.
Do not confuse	Social links are public presentation links. Store users are internal access records. Changing a social link does not grant a person access to the Seller Portal.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller profile, security and account controls

The personal Seller profile controls the account behind the store. It is distinct from the public Store Profile described on the previous pages.

Feature	Where	What the user can do
Profile	Profile	View the seller's account information and profile image.
Edit Profile	Profile -> Edit	Update permitted personal/account fields and upload or delete the account profile image.
Change password	Profile -> Change Password	Use the seller's password-change flow. Depending on the action, a code verification flow may be used.
Email / phone verification	Profile service	Request and confirm account verification where the feature is available.
Profile reviews	Profile service	View review history made available to the seller account.
Delete account	Profile service	Use the protected account deletion control only after reviewing the consequence for store operations and records.
Logout	Header/profile	End the Seller Portal session safely, especially on shared devices.

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Product list, search, filtering and product states

Products is the catalogue workspace for a store. Sellers can browse their products, select records, search and change supported product state controls before or after editing full product data.

Feature	Where	What the user can do
Product list	Products	View product cards/list data with image, product name, categories, pricing and status information delivered by the seller product service.
Search and filters	Products	Use the search field and available filter controls to narrow products. Clear filters to restore the full result set.
Categories	Products / Add Product	Load the current category list before creating a product; the category drives the type-specific form data.
Status / visibility	Product controls	Use supported status controls, including active state and mute/unmute operations where shown.
Boost shortcut	Product controls	Start/trigger a boost action from an eligible product, then complete campaign information in Boost Ads.
Delete	Product detail/control	Delete a product only after confirming. Product/order history restrictions are enforced by backend rules.
Admin connection	Admin can separately inspect product records and approve/reject, toggle active visibility, mute, approve boosts or delete under admin permissions. Seller list status reflects the shared record state.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Create and edit products

Add Product starts by selecting the category/product type, then uses the relevant product form. The project includes frames/eyeglasses, sunglasses, contact lenses, eye hygiene and accessories.

Feature	Where	What the user can do
General product creation	Products -> New Product	Choose a category/type and continue to the matching form. The generic path also supports category selection and SKU suggestion.
Eyeglasses / frames	Products -> New -> Eye Glasses	Create frame/eyeglass records using the form data and image/option controls for that product type.
Sunglasses	Products -> New -> Sun Glasses	Create a sunglasses record with its applicable fields and product images.
Contact lenses	Products -> New -> Contact Lenses	Create contact lens data with basic information, price/inventory, images, options and product state.
Eye hygiene	Products -> New -> Eye Hygiene	Create eye hygiene products using basic information, price/inventory, images, options and state controls.
Accessories	Products -> New -> Accessori	Create accessory records with the same core sections adjusted for the accessory type.
Edit product	Products -> product -> type-specific edit	Open the correct type edit page. Update supported fields and save; the record returns to its relevant product/list detail context.

Core form groups

Across the type-specific forms, the project groups fields as Basic Information, Pricing and Inventory, Images, Options and Product Status. Exact fields change by product type and selected category.

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Product images, variants and frame sizes

A product can need more than basic catalogue information. The Seller Portal has separate controls for image upload, variants and frame sizes where the product supports them.

Feature	Where	What the user can do
Product images	Create/edit form	Upload images for the product. The upload service connects images to the product; remove or replace an image where the form provides it.
Pricing and inventory	Create/edit form	Set price, stock/inventory and the product's SKU or suggested SKU as the relevant form requires.
Variants	Product service	Create, update, delete and set a default variant. A buyer's selected variant is kept with the cart/order item.
Frame sizes	Product service	Create and manage frame-size records for the applicable product.
Product choices	Variants and frame sizes keep store product choices clear. A buyer's selected variant remains linked to the cart and the resulting order item for fulfilment review.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller marketplace orders: list and detail

Seller Orders contains marketplace shipments assigned to the signed-in store. It is different from Warehouse Orders, which are seller supply purchases from the warehouse channel.

Feature	Where	What the user can do
Order list	Orders	View store shipments. Use status filter chips/controls for All, Pending, Awaiting Payment, Paid, Out for Delivery and other available statuses.
Order detail	Orders -> shipment	See buyer/shipment data, products, quantities, selected variants, totals, delivery summary and payment state.
Pending action	Shipment detail	For a pending financial shipment, accept or reject it. Acceptance opens delivery quotation inputs.
Delivery quotation	Shipment detail	Enter delivery fee, estimated delivery date, delivery method and optional delivery notes, then submit. The buyer receives the awaiting-payment shipment.
Payment state	Shipment detail	See payment/escrow data supplied for the shipment. Seller delivery progress depends on the allowed state.
Status badge	List and detail	Use the visible status label to understand the next allowed action. Backend rules prevent invalid transitions.
Key distinction	A seller sees only its store shipment, not another store's shipment in the same buyer checkout. Admin sees the overall order and all store shipments.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller delivery actions and order completion

The standard seller delivery journey starts after acceptance and payment. Seller actions are shown only for the statuses that allow them.

Feature	Where	What the user can do
Mark out for delivery	Shipment detail	When the shipment is paid/processing, mark it Out for Delivery. This tells the buyer that delivery is underway.
Request delivery code	Out for Delivery shipment	Request the buyer delivery code through the supported action. The buyer sees their OTP in order details.
Confirm delivery	Out for Delivery shipment	Enter the six-digit buyer delivery code and confirm delivery. The backend validates the code before moving the shipment forward.
Reject/cancel path	Pending/allowed shipment state	Use the available rejection/cancellation action only when it appears. The record remains in order/financial history.
Seller earnings	After confirmed delivery	The order flow can release seller earnings through the wallet/escrow workflow. Read Wallet ledger history for the resulting entry.
Delivery code safety	The buyer is instructed to give the delivery code only after products are received. Do not request or enter it before the actual handover.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller Wallet, ledger, top up and payout

Seller Wallet is the finance workspace for store earnings and campaign funding. It provides balance components, finance history and two protected modal actions: Add Funds and Request Withdrawal.

Feature	Where	What the user can do
Wallet summary	Wallet	See available balance, ad-reserved balance, ad spend, pending earnings, top ups, locked escrow, total earnings, reserved commitments and disputed earnings.
Add Funds	Wallet -> Add Funds	Open the funding modal, enter an amount (current form validates EUR 5-100,000) and confirm. The ledger then refreshes.
Request Withdrawal	Wallet -> Request Withdrawal	Enter amount, account name, account number and bank name. The form checks amount/balance and blocks invalid requests.
Transaction History	Wallet	Read date, type, campaign/order reference, amount, status, available balance after and ad-reserved balance after. Links can open the related boost campaign or order.
Withdrawal History	Wallet	See request number/date, amount, current status, payout reference and Admin notes.
Debt / dispute warning	Wallet	A refund debt or disputed balance warning can restrict some actions. Resolve the underlying order/finance issue rather than bypassing it.
Admin connection	Admin Finance receives the seller wallet ledger and withdrawal records. When processing a withdrawal, Admin may add notes and a bank payout reference before marking the withdrawal complete.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Discount Campaigns (Promotions)

Discount Campaigns are managed from the Promotions / Discount Campaigns area. They are distinct from coupon codes: a campaign publishes discount rules; a coupon is a code and eligibility rule set.

Feature	Where	What the user can do
Campaign list	Discount Campaigns / Promotions	View current discount campaign records and their managed state.
Create campaign	Discount Campaigns	Use the campaign manager to create a discount campaign with the applicable fields and product/offer configuration provided by the form.
Edit campaign	Campaign manager	Open the current campaign editing control, adjust allowed data and save.
Pause/resume/delete	Campaign controls	Use the available lifecycle action. A paused campaign stops its active promotion behavior while keeping its management/history record.
Buyer outcome	Buyer campaign/product pricing	Eligible buyers see campaign information and product pricing through the commerce campaign service. Checkout calculation validates the final eligibility.
Practical workflow	Create the campaign, select the eligible conditions/products in the available manager, save, then inspect buyer-facing pricing/campaign data before promoting it. Admin can supervise discount campaign activity from its Marketing area.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Coupons: create, manage, analyse

Coupons are seller-managed codes for store, product, category or variant scopes. Dedicated pages exist for the list, create, detail and edit paths.

Feature	Where	What the user can do
Coupon list	Coupons	View coupon cards/rows, key statistics and filters by status, type and scope.
Create coupon	Coupons -> Create New Coupon	Open the dedicated form. Enter the code, description, discount type/value and all rule/target data requested by the form.
Coupon scope	Create/edit coupon	Choose entire store, products, categories or variants. Select the applicable targets when the chosen scope needs them.
Schedule and limits	Create/edit coupon	Set start/end schedule, minimum order amount, total usage limit and per-buyer limit as applicable.
Eligibility switches	Coupon detail/form	Use public discovery, followers-only and first-paid-order-only rules when offered.
Detail and performance	Coupons -> coupon	Read coupon rules, target list, active state, usage history, redeemed/reserved counts, remaining allowance and schedule timezone.
Lifecycle	List/detail	Edit, pause/resume, activate/deactivate or archive a coupon. Archived coupon order history is preserved.
Buyer outcome	At cart/checkout the buyer can validate, quote and apply a coupon. The backend rechecks dates, targets, limits and order totals at placement so a saved code is not a promise of eligibility.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Referral Campaigns

Referral Campaigns let a store budget rewards for referred buyers and measure the result. The campaign form reserves budget from the Seller Wallet and campaigns may require Admin approval.

Feature	Where	What the user can do
Campaign list	Referral Campaigns	View name, identifier, scope, reward, status, approval state, activation timing, budget use and performance metrics.
Create / edit	Referral Campaigns -> Create/Edit	Set campaign name, scope, fixed/percentage reward, optional cap, budget, minimum eligible subtotal/quantity, activation, ending time and buyer limits.
Eligible targets	Referral Campaign form	Choose entire store, selected products, selected categories or mixed scope. Select the matching products/categories when the form shows the pickers.
Rules	Referral Campaign form	Choose new-customer-only and platform stacking behavior where allowed. Choose immediate activation after approval or a scheduled start.
Campaign details	Referral Campaigns -> campaign	Read rules, eligible products/categories, referral reward history and performance: clicks, registrations, qualifying orders, rewards, revenue, cost, net revenue and remaining budget.
Lifecycle	Campaign detail/list	Pause, resume or archive a campaign. Archive releases/resolves campaign state according to backend rules; approval state is visible.
Money flow	Campaign budget is reserved in the Seller Wallet. Referral rewards are only created after the configured qualifying order condition. Admin Referral Program can approve, suspend, reject or review rewards and settings.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Boost Ads / Boost Product campaigns

Boost Ads promotes an eligible seller product through paid campaign records. It is connected directly to Seller Wallet funding and the seller's ad-reserved/ad-spend balances.

Feature	Where	What the user can do
Boost list	Boost Ads	View existing ad campaign records and open a campaign detail page.
Boost Product	Boost Ads -> Boost Product	Open the boost wizard, choose product and campaign values requested by the wizard, then create the campaign.
Add Funds	Boost Ads -> Add Funds	Open the compact seller-wallet funding sheet and add a permitted EUR amount before/while preparing paid boost activity.
Campaign detail	Boost Ads -> campaign	Review the campaign's product, state and finance/performance information supplied by the ad service.
Product boost action	Products	Eligible product controls can direct the seller into a boost action using that product as the campaign starting point.
Admin review	Admin -> Boost Campaigns	Admin can inspect campaign records and approve related boost work under its moderation permissions.
Result	Ad spending appears in the Seller Wallet ledger with a boost-campaign reference. The platform also records marketing/ad data used in its Admin dashboard and CRM read-only overview.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Banners and store announcements

Banners and announcements are two different communication tools. A banner is a visual/placement record; an announcement is a timed buyer-facing text update.

Feature	Where	What the user can do
Banners	Banners	List seller banner records, create, edit, delete, toggle active state and reorder banners. Upload/configure images and placement data through the banner form.
Banner ordering	Banners	Use the reorder control to arrange active banner sequence. Buyers receive public banners by placement through the public/commerce campaign services.
Announcements list	Announcements	View announcement records and filter/time fields. Open a record for its message and lifecycle controls.
New announcement	Announcements -> New	Create a timed store update with title, message, start date and end date. Save makes it available according to its active/schedule state.
Announcement detail	Announcements -> announcement	Read full message, start/end dates and current active/draft state. Edit, activate/pause or delete using the available buttons.
Admin banner oversight	Admin -> Store Banners	Admin can list, inspect, approve/reject, toggle active status or delete store banner records.
Date fields	Announcements and campaign features use date/date-time controls in the current interfaces. Use the calendar/date input and confirm the displayed schedule before saving.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Warehouse: supplier catalogue and cart

Warehouse is a seller supply-purchase channel. It is not the same as the buyer marketplace product list or a buyer order. Sellers use it to purchase warehouse products and see their warehouse cart/order records.

Feature	Where	What the user can do
Warehouse catalogue	Warehouse	View warehouse products and use available product/category/filter controls. Open a product to see warehouse-specific details.
Warehouse product detail	Warehouse -> product	Review the warehouse item's available data and use the purchase/cart action where permitted.
Warehouse cart	Warehouse -> Cart	Add, update quantity or remove warehouse items. The cart reflects the seller's current supply order selection.
Checkout warehouse cart	Warehouse Cart	Submit a warehouse cart through the warehouse checkout action. The backend creates a separate seller warehouse order.
Warehouse orders	Warehouse -> Orders	View warehouse order history and open the detail for a specific seller warehouse order.
Admin Warehouse	Admin -> Warehouse	Admin manages warehouse dashboard/product/category/order records, including warehouse order status data.
Do not confuse	Marketplace Orders are buyer purchases from a seller store. Warehouse Orders are seller purchases from the platform warehouse. They have different lists, carts and order records.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller messages, buyer chat and Admin chat

Messages centralises conversations. The project provides a buyer-store conversation channel and a separate seller-to-Admin channel.

Feature	Where	What the user can do
Buyer conversations	Messages	Open buyer-store conversations, load message history and send a message. These are the conversations buyers start from a public store or Buyer App.
Customer details	Message list/detail	Conversation data includes the customer/store context supplied by the chat service. Use it to identify the request before replying.
Admin conversations	Messages	Open seller-Admin conversation records and exchange messages through the dedicated seller-admin chat API.
Attachments	Chat/support forms where enabled	Use the attachment selection/upload path only where present. Upload success is part of the message/ticket workflow; errors are shown to the sender.
Unread state	Header/sidebar/message category	Unread counts and category state are provided by the notification/sidebar service so sellers can see communication that needs attention.
Connection	Admin Messages can start or open a store conversation, load its history and send replies. This makes seller support communication auditable without mixing it with a buyer-chat thread.	

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller notifications, reviews, support and guide

Seller operational alerts appear in Notifications and the portal can expose unread counters. Formal Support Tickets remain separate from product/store reviews and order messages.

Feature	Where	What the user can do
Notifications	Notifications / header	View notification list, unread count and read state. Use mark-read or mark-all-read controls; relevant notifications can provide a destination context.
Reviews	Profile/store service	View review-related data available to the seller. Buyer reviews are submitted only after eligible completed purchases.
Support Tickets	Support service	List tickets, create a ticket, open a ticket, reply, close or reopen it. Use attachment download/upload where the ticket record provides it.
Help / Guide	Guide route when exposed	Open seller guidance content in the project. Keep business operations aligned with platform policies and approval rules.
Live refresh	Portal services	Notifications, lists and operational values refresh after successful actions and through the project's live refresh patterns.

3. SELLER USER MANUAL

3. SELLER USER MANUAL

Seller analytics and performance reading

Seller Analytics is the performance screen for turning activity into practical store decisions. It is separate from the dashboard quick view and from the Admin marketplace-wide analytics.

Feature	Where	What the user can do
Monthly trends	Analytics	Review monthly performance trend charts/data supplied by the seller analytics service.
Order status breakdown	Analytics	See how orders are distributed by operational status. Use it to identify outstanding delivery/payment work.
Recent orders	Analytics	Review a current order slice and open the operational Orders area when action is needed.
Store overview/stats	Store / Dashboard	Use store stats, dashboard data and follower information for a focused store view.
Campaign performance	Referral / Coupon / Boost details	Read campaign-specific figures in the relevant feature rather than assuming all marketing figures are identical.
Use the right view	Dashboard is for immediate awareness; Analytics is for trend/status review; Wallet is for money; campaign detail screens are for a campaign's exact metrics and lifecycle.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Admin access and dashboard

Admin is the platform oversight role. Its portal is organised by People, Operations, Marketing, Communication, Finance and System, with live count badges for items needing attention.

Feature	Where	What the user can do
Admin login	Admin Login	Sign in using an Admin account. The backend uses admin middleware/abilities to protect all administrative actions.
Dashboard	Dashboard	View platform overview, date range selection, revenue performance, order status, monthly orders, warehouse overview, revenue sources, best sellers, recent activity and insights.
Export	Dashboard where available	Export dashboard-related data when the current action is offered.
Live badges	Admin sidebar	See counts for finance withdrawals, referrals, seller/product approvals, boost campaigns, orders, messages, support, reports, banners and discount campaigns.
Admin notifications/toasts	Portal UI	Receive operation feedback and notification state in the Admin experience after actions or incoming attention items.
Admin responsibility	Admin should use management actions to enforce policy and correct workflow exceptions, not to replace normal Buyer/Seller order steps. Every action should have a business reason.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

People: users and sellers

The People area separates general user management from seller/store approval. It is where Admin controls account access and reviews seller identity/state.

Feature	Where	What the user can do
Users list	People -> Users	Search, filter and view user records. The list supports user/admin management fields exposed by the current service.
Create / edit user	Users	Create, update or open a user record with permitted account details.
Block / unblock	Users / user detail	Change a user's blocked state when policy requires it. Use the account detail to verify the correct person first.
Delete user	Users	Delete only when the operation is explicitly appropriate. Related historical commerce records may be retained by backend business rules.
Sellers list	People -> Sellers	Search seller records and open full seller/store detail data.
Approve / reject seller	Sellers / seller detail	Approve a qualified seller or reject an application. This connects to Seller pending-approval/suspended access states.

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Operations: products and categories

Admin has a platform-wide product and category view. Seller product data is managed by the store, but Admin controls moderation and catalogue governance.

Feature	Where	What the user can do
Products list	Operations -> Products	View marketplace products and open a product detail record.
Product moderation	Product detail/list actions	Approve or reject a product, control active visibility, mute/unmute, approve boost work or delete when the current Admin ability permits it.
Product detail	Products -> product	Inspect the product's shared data before making a moderation decision.
Categories	Operations -> Categories	Search the category tree and create, edit or delete category data. The current form includes category content such as the Italian title field where configured.
Category impact	Categories -> Seller products	A category affects Seller product creation and buyer category browsing. Use careful changes because category configuration can affect product options.
Workflow	Seller creates/edits a product -> Admin reviews/controls the record -> active catalogue data becomes available to buyers under the relevant visibility rules.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Operations: marketplace orders

Admin Orders provides the complete buyer order view and its store shipments. It is the authoritative oversight page for payment, delivery, shipment items and permitted intervention.

Feature	Where	What the user can do
Orders list	Operations -> Orders	Search by order reference and filter by payment status: pending, paid, failed, refunded or cancelled. Open an order for full detail.
Order detail	Orders -> order	See buyer information, order totals, store shipments, address snapshots, delivery information, item lines, selected variant, lens configuration and prescription data where present.
Payment / refund data	Order detail	Read payment ID, method, amount, transaction, refund transaction and refund reason where those records exist.
Shipment action	Order detail	Choose an allowed status action. The portal exposes choices based on current shipment/payment state, such as processing, out for delivery, delivered, refunded, disputed or cancelled.
Delivery code	Order detail -> delivery action	When Admin marks an allowed shipment delivered, enter the buyer delivery code. This respects the same delivery confirmation concept used by the seller.
Safe handling	Always open the order detail before changing a status. The product/financial history shown there helps Admin decide whether an exception should be processed, refunded or disputed.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Operations: Warehouse

Admin Warehouse is the management side of the seller supply channel. It is separate from the buyer marketplace catalogue and buyer checkout flow.

Feature	Where	What the user can do
Warehouse dashboard	Operations -> Warehouse	Review warehouse overview data.
Warehouse products	Warehouse	Create, update, inspect and manage warehouse product records.
Warehouse categories	Warehouse	Create, update and manage warehouse-specific category records.
Warehouse orders	Warehouse	Review seller warehouse orders, open order detail and update permitted warehouse-order statuses.
Seller use	Seller -> Warehouse	Sellers browse warehouse products, add items to a warehouse cart and submit warehouse checkout. Admin works on the resulting supply order record.

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Marketing: boost, discount campaigns and banners

Admin Marketing supervises seller promotional activity at marketplace level. It does not replace a seller's campaign setup screen; it is the approval, review and platform management layer.

Feature	Where	What the user can do
Boost Campaigns	Marketing -> Boost Campaigns	View seller ad/boost campaign records and use available approval/management controls.
Discount Campaigns	Marketing -> Discount Campaigns	View and supervise seller discount campaign activity and data supplied by the campaign feature.
Store Banners	Marketing -> Store Banners	List banner records, open detail, approve/reject, toggle active state or delete a banner.
Campaign relationships	Seller marketing modules	Seller discount/boost/referral/coupon work can affect buyer-facing offers, marketing placement and wallet/ledger activity.
Ad performance	Dashboard / CRM data	Platform ad revenue/performance contributes to platform reporting. The CRM read-only integration exposes an ads performance resource.
Banner status	A seller can create and arrange banners, but Admin is able to approve/reject and control active state at the marketplace level. Do not promise a buyer display until the record is approved/active where that rule applies.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Marketing: Coupons

Admin Coupons is the platform review view for seller coupons. It lets Admin monitor use and audit history while sellers create the actual coupon rules for their store.

Feature	Where	What the user can do
Coupon list	Marketing -> Coupons	Search/filter coupon records and select a coupon to inspect its summary.
Coupon detail	Coupons	Read store association, code, status and coupon data exposed by the admin service.
Usage and audit	Coupon detail	Review usage records and audit history to understand how/when a coupon was changed or used.
Enable / disable	Coupons	Control coupon availability using enable, disable or toggle actions. Seller may also pause/resume/archival-manage its own coupon.
Delete	Coupons	Delete only after reviewing uses and audit information. The seller coupon detail retains protected commerce history according to backend behavior.

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Finance: wallets, revenue and withdrawals

Marketplace Finance brings together seller wallet balances, seller ledger entries, platform revenue, buyer transactions and seller payout requests.

Feature	Where	What the user can do
Seller wallets	Finance -> Seller Wallets	See available, pending, reserved, ad-reserved, ad-spend, top-up, disputed, debt and total earnings balances for a seller wallet.
Seller transactions	Finance -> Seller Ledger	Review ledger rows, references to a campaign/shipment/withdrawal, payment method metadata and before/after balance changes.
Platform revenue	Finance -> Platform Revenue	Review platform ledger records connected to marketplace financial activity.
Buyer transactions	Finance -> Buyer Wallet Transactions	Filter by buyer ID and inspect buyer wallet transaction records.
Withdrawals	Finance -> Withdrawals	Review bank details, amount, status, payout reference and notes. Apply allowed withdrawal status updates.
Complete payout	Withdrawal action	When choosing Completed, enter required notes and bank payout reference. This provides a traceable result for the seller.
Finance discipline	Wallet balances change from real workflow entries: delivery/earnings, funding, campaign spend, withdrawals, refunds or reversals. Use ledger information before changing a payout state.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Finance: referral program

Admin controls global referral settings and can supervise seller referral campaigns and referral rewards.

Feature	Where	What the user can do
Referral settings	Finance -> Referral Program	Configure platform referral enablement, reward type/amount, maximum reward, minimum order, attribution days, waiting days, monthly and per-buyer limits.
Referral safeguards	Referral settings	Control seller approval requirement, existing-buyer policy, referral stacking and email/phone verification requirements.
Referral campaigns	Referral Program	Review seller campaign records and use approval, suspension or rejection actions where available.
Referral rewards	Referral Program	Review conversion/reward records and approve, suspend, reject or reverse rewards under the available lifecycle action.
Referral audit/export	Referral Program	Read audit entries and export results when the feature is offered.

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Communication: Messages and Support

Admin can communicate with stores and process formal support tickets. Use the right channel so conversation history stays meaningful.

Feature	Where	What the user can do
Admin Messages	Communication -> Messages	Start/open a store conversation, load conversation history and send a message. The seller sees this in the seller-admin chat channel.
Store context	Message start/detail	Select or use the correct store context before sending. This avoids mixing a question into the wrong seller conversation.
Support list	Communication -> Support	View support ticket list and open a ticket for its details.
Support ticket	Support -> ticket	Read ticket messages/attachments, send a reply and update ticket status/priority through the available controls.
Attachments	Support ticket	Use attachment download/support upload paths where provided. Files remain tied to the formal support record.
Channel choice	Use Admin Messages for store operational communication. Use Support for a formal help record that needs ticket status, reply history and attachment handling.	

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Communication: Store Reports and reinstatements

Store Reports is the moderation path for buyer reports and store-related review work. It also contains the reinstatement request list for sellers whose stores need a decision.

Feature	Where	What the user can do
Report summary	Communication -> Store Reports	Review overall report workload and open individual reports.
Report detail	Store Reports -> report	Read the report information and related store context before choosing an action.
Report lifecycle	Report detail	Update report status and use available warn, suspend or remove actions when policy and evidence support it.
Reinstatement	Store Reports	Review seller store reinstatement requests and record the decision. The Seller Portal shows the result through the store status workflow.
Store enforcement	Reports / Sellers	Coordinate a store status action with seller approval and reports. Do not use a punitive action without the record/policy basis.

4. ADMIN USER MANUAL

4. ADMIN USER MANUAL

Analytics, activity logs and system settings

The Admin Portal has a marketplace-wide analytics view, auditable activity log and a settings area for common platform configuration.

Feature	Where	What the user can do
Analytics	Communication -> Analytics	View revenue, user growth, sales trends and top products by views.
Activity Logs	Communication -> Activity Logs	Review recorded Admin/system actions for accountability and troubleshooting.
Settings	System -> Settings	Read/update platform settings. Current settings include platform name and platform email, with data held in platform settings storage.
Date range	Dashboard / analytics controls	Use the available date range selector before interpreting charts and current-period figures.
Permissions	Backend abilities	Admin endpoints are protected by specific abilities. If an action is absent, use an account with the relevant permission rather than changing application data outside the portal.

5. COMPLETE WORKFLOWS

5. COMPLETE WORKFLOWS

End-to-end order workflow

This is the normal buyer-to-seller order journey found in the current project. The precise next action is driven by shipment/payment state, so the platform blocks invalid jumps.

- 1 Buyer browses a store/product, chooses any required variant, lens or prescription information, then adds the configured item to the cart.
- 2 Buyer selects an address, reviews discounts/coupon eligibility and places checkout. The system creates an overall order and one store shipment per store.
- 3 Seller opens the pending shipment. The seller accepts/rejects it. On acceptance, the seller records delivery fee, estimated date, method and notes.
- 4 The shipment moves to Awaiting Payment. Buyer opens the order/shipment and completes the payment action for that shipment.
- 5 After payment, Seller progresses shipment to Out for Delivery, requests the delivery code and confirms the six-digit code after actual handover.
- 6 The buyer sees Delivered, can review products/store, and the financial workflow can release seller earnings. Admin can inspect every layer and handle allowed exception/refund/dispute actions.

Multi-store checkout	Each seller progresses only its own shipment. One shipment can be delivered while another is still awaiting payment or out for delivery. The buyer-level order groups them for convenience.
----------------------	---

5. COMPLETE WORKFLOWS

5. COMPLETE WORKFLOWS

Order status and responsibility map

Statuses are displayed in different role views, but the underlying store shipment is shared. The table shows the normal owner of each step.

Feature	Where	What the user can do
Pending	Seller Orders / Buyer Orders	Seller reviews the new shipment and can accept/reject according to available controls.
Awaiting Payment	Buyer Order Detail	Buyer reviews seller delivery quote and completes shipment payment.
Paid / Processing	Seller Order Detail	Seller prepares the shipment. Admin can see the payment/financial data and permitted exception actions.
Out for Delivery	Seller and Buyer Order Detail	Seller marks the shipment on the way and requests the buyer delivery OTP.
Delivered	All role order views	Seller confirms code after handover; buyer can review; finance history reflects the resolved fulfilment outcome.
Cancelled / Refunded / Disputed	Allowed role/administrative action	Use the current permitted control and review payment/refund/dispute context. Admin has the broadest oversight/action path.
Never bypass the state	A visible action is intentionally limited by the current shipment/payment state. For example, a delivery code is only meaningful when a shipment is out for delivery.	

5. COMPLETE WORKFLOWS

5. COMPLETE WORKFLOWS

Wallet, payout and campaign money flow

The project has buyer wallet records and a more detailed seller wallet ledger. These are linked to different financial reasons but both are visible to Admin Finance.

Feature	Where	What the user can do
Buyer top up	Buyer Wallet	Buyer funds the personal wallet; balance and transaction history update. Current UI enforces the displayed minimum.
Buyer withdrawal	Buyer Wallet	Buyer submits bank details and amount; system validates balance/minimum and records the request/transaction.
Seller funding	Seller Wallet / Boost Ads	Seller adds funds through wallet or Boost Ads funding. The ledger includes funding and ad campaign references.
Seller earning	Delivery completion	Confirmed delivery can release earnings from the order/escrow process to the seller financial position.
Referral budget	Seller Referral Campaign	Campaign creation reserves seller wallet budget. Reward history and refund/reversal logic flow through controlled records.
Seller payout	Seller Wallet -> Request Withdrawal	Seller submits bank details/amount. Admin reviews the request and can add notes and a payout reference on completion.

5. COMPLETE WORKFLOWS

5. COMPLETE WORKFLOWS

Discounts, coupons, referrals and boosts

Marketing tools each serve a different job. Use the one that matches the business goal, then inspect the exact campaign/coupon detail rather than assuming they work the same way.

Feature	Where	What the user can do
Discount campaign	Seller Promotions	Creates product promotion rules. Buyer sees campaign content/eligible pricing; Admin sees marketing oversight.
Coupon	Seller Coupons	Creates a code with discount, scope, schedule, eligibility and usage limits. Buyer validates/applies the code in checkout.
Referral campaign	Seller Referral Campaigns	Offers a referral reward with a reserved seller budget, eligible targets and performance metrics. Admin approval/settings can control it.
Boost ad	Seller Boost Ads	Funds/promotes an eligible product through an ad campaign. Ad spend is tracked in Seller Wallet and platform reporting.
Banner	Seller Banners	Places visual seller marketing content subject to active/approval rules; buyers receive public banner placements.
Announcement	Seller Announcements	Publishes a timed text update for store buyers rather than a discount calculation.
Checkout truth	Buyer-facing pricing is always recalculated by the backend for the actual cart/order. A campaign card, coupon code or referral link alone does not override validation, limits, dates or payment outcome.	

5. COMPLETE WORKFLOWS

5. COMPLETE WORKFLOWS

Messages, support and notifications

The platform uses three related but different ways to communicate. Selecting the right one improves history, ownership and resolution tracking.

Feature	Where	What the user can do
Buyer-store chat	Buyer Store / Seller Messages	A shopper asks a store about products/orders. Seller replies in the buyer conversation. It is informal operational messaging.
Seller-Admin chat	Seller Messages / Admin Messages	A seller and Admin discuss store/platform matters in a dedicated conversation with its own history.
Support ticket	Buyer/Seller Support / Admin Support	A formal help record. It has ticket list/detail, replies, status/priority controls and attachment handling.
Notification	Role header / Notifications	An alert about an event or record. It has unread state and may navigate the recipient toward the related order/message/record.

Attachment handling

Where chat or ticket file upload is available, wait for upload success before assuming a file was sent. The record should show the attachment in its own conversation/ticket history.

5. COMPLETE WORKFLOWS

5. COMPLETE WORKFLOWS

Store moderation and public visibility

Seller content is not isolated. Public buyer pages reflect store/product/banner data that has passed the platform's relevant live/active/approval rules.

Feature	Where	What the user can do
Seller account	Admin Sellers	Admin approval/rejection affects whether seller operations can proceed.
Product	Admin Products	Admin product moderation and active/mute controls affect buyer catalogue availability.
Banner	Admin Store Banners	Admin can approve/reject/toggle/delete a seller banner. Buyer banners use active public placement data.
Coupon/campaign	Admin Marketing	Admin sees platform review lists and may control availability depending on the feature/permission.
Store report	Admin Store Reports	Buyer reports lead to investigation and possible warning, suspension or removal; seller reinstatement requests are handled here.

6. FEATURE-TO-FEATURE RELATIONSHIPS

6. FEATURE-TO-FEATURE RELATIONSHIPS

Feature relationship map

This quick reference helps a client understand why a change in one area may appear elsewhere. It is intentionally practical, not a technical database diagram.

Feature	Where	What the user can do
Store images/profile	Seller Store	Changes Buyer public store page and may change the visual store context in products/conversations.
Product variants	Seller Products	Changes the available buyer choice and keeps the selected variant on cart/order items.
Product stock/status	Seller Products / Inventory	Changes seller list visibility and can affect Buyer availability; low-stock data is available to the seller.
Order delivery quote	Seller Order Detail	Changes Buyer shipment payment/delivery information and can unlock the buyer payment step.
Delivery confirmation	Seller Order Detail	Changes buyer status/review eligibility and seller earnings/finance workflow.
Coupon/referral/boost	Seller Marketing / Wallet	Changes campaign/offer data and creates finance/ledger effects that Admin can audit.
Buyer report/support	Buyer -> Admin	Creates a formal Admin queue rather than changing store/product data directly.

7. IMPORTANT SYSTEM PROCESSES

7. IMPORTANT SYSTEM PROCESSES

Validation, feedback and safe operations

The project uses client forms plus backend validation. A button being visible does not guarantee the action will succeed if a required field, permission or state condition is missing.

Feature	Where	What the user can do
Required fields	Forms	Complete fields marked required. The client highlights invalid values and the backend returns a message if a rule is not met.
Amounts	Wallet/campaign/coupon/order forms	Use valid numeric amounts within the displayed min/max. Examples: current buyer/seller funding uses a displayed minimum; seller payout checks available balance.
Dates	Campaigns/coupons/announcements/orders	Use the supplied date/date-time picker/input. Check start/end order and local display time before saving.
Uploads	Product/store/banner/message/support	Wait for upload completion and check error/success feedback. An image/file must be uploaded to be included in the saved record.
Status actions	Orders/campaigns/coupons	Only choose a transition listed for the current state. Backend rules prevent a user from forcing an invalid delivery/payment/campaign step.
Success/error feedback	All modules	Read green success or red error messages before moving away. Successful actions reload the relevant record/list so the client can verify the result.

7. IMPORTANT SYSTEM PROCESSES

7. IMPORTANT SYSTEM PROCESSES

Common filters, search and modals

Small controls are important because they help people work safely with large lists. The exact options depend on the module, but they follow consistent patterns.

Feature	Where	What the user can do
Search field	Products, Stores, Orders, Users, Categories, Coupons	Enter a name, code, reference or applicable text. Apply/submit the search where a separate Search button appears.
Status filter	Orders, Coupons, campaigns, management queues	Choose a status to show only matching records. Selected state is visually indicated; clear/reset returns to all records.
Type/scope filter	Coupons/products/marketing	Narrow results by type, category/scope or similar data values supplied by that module.
Date/date-time input	Scheduled records	Select the schedule boundary. On a detail screen, read the formatted stored time to confirm it saved correctly.
Modal/bottom sheet	Wallet funding/withdrawal and compact actions	Enter a focused amount or small form, cancel to keep the prior state, or confirm to submit. Long multi-field management forms use full pages where the current portal provides them.
Confirm dialog	Delete/archive/close	Confirm only after reviewing the current record. Cancel leaves it unchanged.

7. IMPORTANT SYSTEM PROCESSES

7. IMPORTANT SYSTEM PROCESSES

What happens when a record is removed or paused

The portal distinguishes between immediate public availability and retained operational history. This is especially important for commerce, campaign and finance records.

Pause Normally stops a coupon, referral campaign, announcement or similar record from being active while retaining it for future resumption/history.	Deactivate / toggle Changes the active/public state of a supported record such as a social link, coupon, banner or announcement.
Archive Retires a campaign/coupon workflow while preserving the records needed for usage/order history. Coupon detail specifically notes that existing history is preserved.	Delete Removes a record through the service where allowed. Product, user and marketing deletions may still leave protected historical references under backend rules.
Close / reopen ticket Changes formal support ticket state. A closed ticket can be reopened where the feature allows it.	Refund / reverse Works through Admin/order/referral finance paths. It should leave transaction/ledger trail rather than merely changing a screen label.
Client policy Before staff delete, archive, pause or refund, make sure they know which action is reversible, which affects public visibility and which enters finance or audit history.	

8. OTHER PROJECT COMPONENTS

8. OTHER PROJECT COMPONENTS

Read-only CRM integration

The Laravel project includes a protected CRM API integration. It is an integration layer, not a daily Buyer/Seller/Admin portal screen.

Feature	Where	What the user can do
Purpose	Laravel CRM routes	Provides approved external CRM consumers with a read-only view of selected platform data using an API key and ability checks.
Overview	CRM Overview	Provides aggregated marketplace overview data.
Users and sellers	CRM resources	Provides read-only user/seller records for permitted CRM use.
Products and orders	CRM resources	Provides product list/detail and order list/detail information for permitted CRM use.
Warehouse	CRM resources	Provides warehouse overview, product and order information.
Ads and leads	CRM resources	Provides ads performance and leads-style data. The code notes that the platform does not keep a separate dedicated leads entity.
Seller subscriptions	Seller API capability	The backend exposes plans, current subscription, subscribe, cancel and feature-check endpoints. The current main Seller Portal navigation does not expose a visible Subscription page, so treat it as a configured/API capability until a client screen is enabled.
Security	This integration is server protected and read-only. It should be configured only by authorised technical staff; it is not a user-facing substitute for the Admin Portal.	

9. QUICK REFERENCE

9. QUICK REFERENCE

Buyer navigation index

Use this index to find Buyer features quickly. Website and app labels can differ slightly, but the service/data is shared.

Feature	Where	What the user can do
Discover	Home / Shop / Categories / Search	Products, categories, stores, campaigns and banners.
Product decision	Product detail	Images, price, store, variants, prescription/lens choices, reviews and add-to-cart.
Purchase	Cart -> Checkout	Cart management, address, coupon validation, order placement and payment after seller review.
Track	My Orders	Order and store shipments, delivery data/code, payment and reviews.
Account	Profile / Account tab	Profile, addresses, wallet, points, wishlist, followed stores, reviews, referrals and password/security.
Talk / get help	Store chat / Support / Help	Store conversation, formal ticket, policies and practical help.
Stay informed	Notifications	Unread count, list and read-state actions.

9. QUICK REFERENCE

9. QUICK REFERENCE

Seller navigation index

Use this index to find Seller functions quickly. The desktop sidebar exposes the broadest current set; mobile navigation focuses on frequent operations.

Feature	Where	What the user can do
Operate	Dashboard / Store / Analytics	Store overview, profile, settings, follower/stats and performance.
Sell	Products / Orders	Product catalogue/type-specific forms, variants, marketplace shipments and delivery actions.
Market	Discount Campaigns / Coupons / Referral / Boost / Banners / Announcements	Promotions, coupon codes, referral rewards, paid boosts and buyer-facing store communications.
Supply	Warehouse / Warehouse Cart / Warehouse Orders	Seller supply catalogue and separate warehouse purchase workflow.
Money	Wallet	Balances, ledger, add funds and request withdrawal.
Communicate	Messages / Notifications / Support	Buyer chat, Admin chat, alerts and support tickets.

9. QUICK REFERENCE

9. QUICK REFERENCE

Admin navigation index

Use this index to find Admin functions quickly. Actions are availability/permission dependent.

Feature	Where	What the user can do
Dashboard	Dashboard	Marketplace overview, performance, trends, operational insight and live counts.
People	Users / Sellers	Accounts, blocking, seller review and approval.
Operations	Products / Orders / Warehouse / Categories	Catalogue moderation, all-order view, supply channel and category governance.
Marketing	Boost / Discount Campaigns / Store Banners / Coupons	Marketing oversight, approval/visibility and coupon audit.
Communication	Messages / Support / Store Reports / Analytics / Activity Logs	Seller communication, formal support, moderation, reports and audit.
Finance	Marketplace Finance / Referral Program	Wallets, ledger, buyer transactions, withdrawals and referral governance.
System	Settings	Platform name/email and system configuration data.

10. GLOSSARY

10. GLOSSARY

Plain-language glossary

These short definitions match the terms used across the project and help non-technical readers follow the workflow.

Feature	Where	What the user can do
Buyer order	Checkout record	The overall order created by the buyer. It can contain shipments from one or more seller stores.
Store shipment	Seller order	The portion of a buyer order owned and fulfilled by one store. It has its own payment, delivery fee, status and items.
Escrow	Order finance state	A protected financial state used by the order workflow. It helps ensure seller earnings are released at the correct delivery point.
Wallet ledger	Seller finance history	A traceable list of changes such as earnings, funding, ad spend, withdrawals, reversals and balance-after values.
Campaign	Marketing record	A scheduled/rule-based promotion such as discount, referral or boost activity.
Coupon	Checkout code	A discount rule with code, scope, date and usage eligibility.
Warehouse order	Seller supply order	A seller purchase from the platform warehouse, separate from a buyer marketplace order.
Notification	Role alert	A read/unread message about an event with an optional related destination.

11. CLIENT HANDOVER

11. CLIENT HANDOVER

Recommended operating routine

The platform is most reliable when staff use clear routines for day-to-day operations and exception handling.

Daily seller routine Check Dashboard/Notifications, answer Messages, inspect pending orders, set delivery quotes promptly, fulfil paid shipments and review low stock.	Weekly seller routine Review Wallet ledger, campaign results, product/stock condition, store content, coupon schedules and referral/boost performance.
Daily admin routine Check live badges, pending sellers/products/campaigns, open support/reports, examine operational order exceptions and payout queue.	Weekly admin routine Review finance/revenue, analytics, activity logs, referral/campaign audit, category/store quality and platform settings.
Buyer support routine Use store chat for store questions. Use order records for payment/delivery questions. Use Support Tickets for formal unresolved platform issues.	Before campaign launch Check date/time, budget, eligible products/categories, stock, coupon/referral rules, buyer-facing wording and required Admin approval.
Final reminder This manual is a guide to the current project implementation. Keep it alongside the client's operating policy, payment/dispute policy and any future release notes that change a workflow.
